Course Duration and Assessment

Duration

Lectures: 6

Labs: 2

Self Study from Mahara tech : 1

○ <https://maharatech.gov.eg/course/view.php?id=2116>

❖ Assessment

- Final Exam : 70%
- Assignments : 10 %
- Labs : 20 %

Agenda

- ❖ **Part 1**
Network Essentials
- ❖ **Part 2**
Cyber Security Essentials
- ❖ **Part 3**
Distributed Systems

Part 1 (Network Essentials)

- **Course Outlines**

- **Computer Networks**

- Definition and Basic Terminologies
- OSI Model

- **TCP/IP Protocol Suite**

- Network Access Layer (Physical Layer /Datalink Layer)
- Internet layer
- Transport layer
- Application Layer

- **Network Devices**

- **Network Media**

Part 1 (Computer Networks Definition)

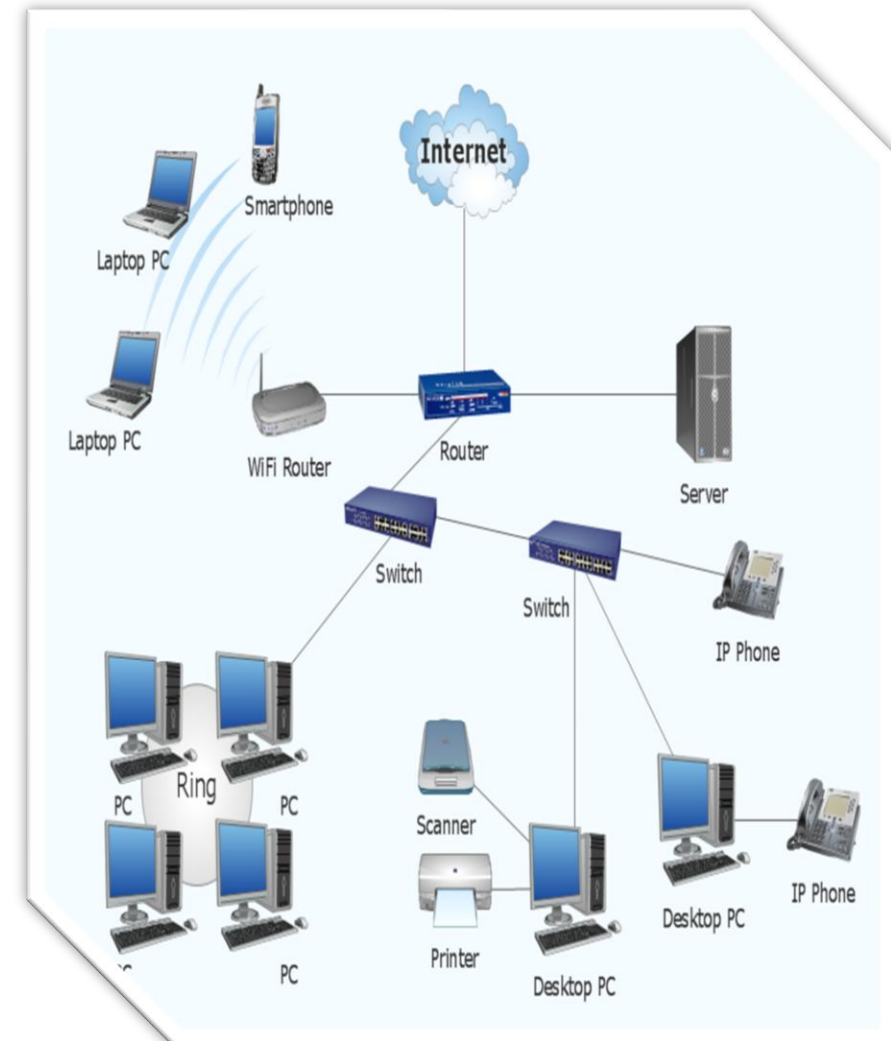

- **Computer Network :**

- a collection of computers, and other devices, or peripherals connected together through connecting media to perform certain task such as :

- Share Resources**

- **Resources can be :**

- File Sharing
- Devices Sharing
- Software Sharing with multi-user licenses.
- Voice and Video calls
- Shared Internet Access

Part1 (Network Elements)

- **Network Elements**

- ✓ **Hardware**

- **Devices**

- Computers – Printers –Phone – Routers - Switches

- **Medium**

- Wired -Wireless –Satellites

- ✓ **Software**

- **Messages**

- Information that travels over the medium such as Mails-WhatsApp....etc

- **Protocols**

- Governs how messages flow across network such as http –https-FTP-RDP

Session 1 (Network Basic Terminologies)

- **NIC (Network Interface Card)/network adapter or LAN adapter.**
 - a hardware that enable the device to directly access the network
 - Internal NIC (plugs into the motherboard directly)
 - External NIC (Wireless and USB based)
- **Mac address:**
 - Physical Address, Unique address over the world burned on the NIC card
- **IP address :**
 - logical address, identify each device on an IP network layer.
- **Protocols**
 - Communication rules that all entity must agree on http –https-FTP-RDP
- **Topology**
 - how devices are connected (shape) and how message flow from one device to another device

Session 1 (Network Basic Terminologies)

- **Hub**

- Allow different nodes to communicate with each other at the same network(Slow the network)

- **Switch**

- Allow different nodes to communicate with each other at the same network and time without slowing each other

- **Router**

- Allow different networks to communicate with each other

- **Access point (AP)**

- allows other Wi-Fi devices to connect to a wired network. An AP is a physical location where Wi-Fi access is available.

- **Repeater**

- Regenerate the signal over the same network before the signal becomes too weak or corrupted

How to apply networks ?

- **According to Covered Area**
 - How large is the network?
- **According to network topology**
 - How the computer are connected?
- **According to network model**
 - What type of model?

Networks Classifications

According to Covered Area

PAN – MAN- WAN-INTERNET

According to Covered Area

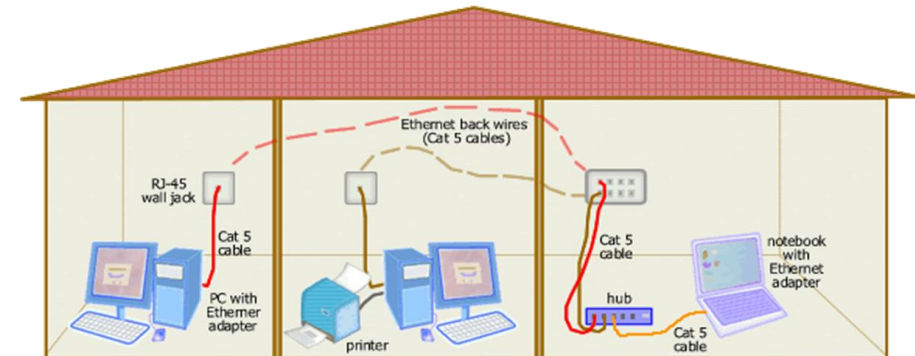

- Personal Area Networks (**PAN**)
 - a computer network for interconnecting devices centered on an **individual person's workspace**.
 - A **PAN** provides data transmission among devices such as computers, smartphones, tablets and personal digital assistants

According to Covered Area

- Local Area Networks (**LAN**)

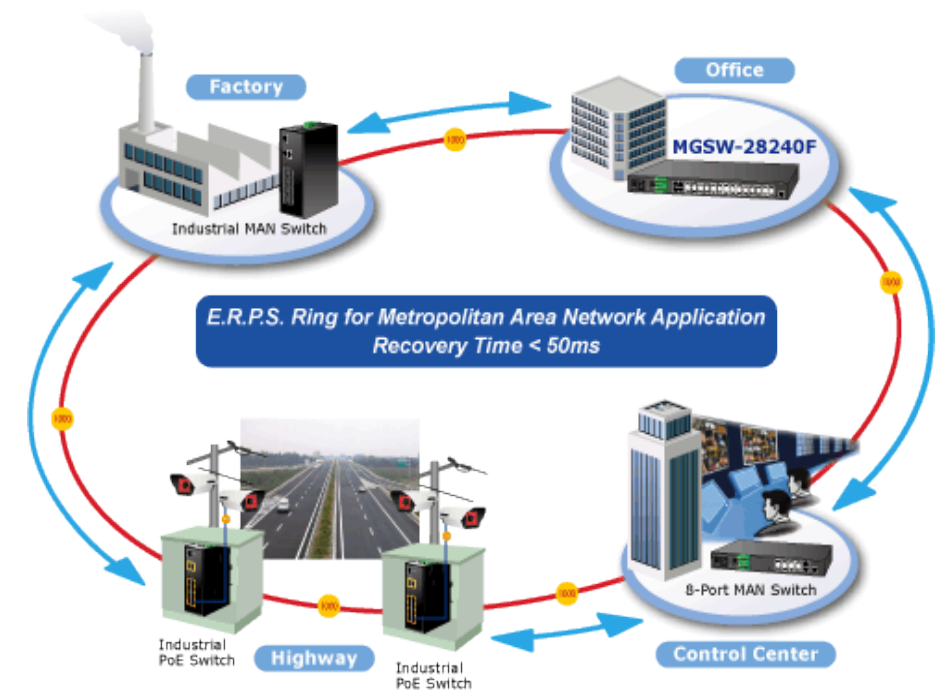

- a **group** of computers connected in **small** geographical area
- a limited area such as a residence, school, laboratory, university campus or office building (100 -1000 M)
- Allow users to share files and services
- **High speed** of communications
- Under your **administrative Control**

According to Covered Area

- Metropolitan Area Networks (**MAN**)
 - A MAN connects an **area larger than a LAN but smaller than a WAN** (Up to 100 km)
 - such as a **city**.
 - dedicated or high-performance hardware

According to Covered Area

- Wide Area Networks (**WAN**)

- A WAN is a group of computers connected in **Large geographical** area such as **country**
- A WAN often connects two LANs (WAN Link)
- WAN can contain multiple smaller networks, such as LANs or MANs.
- Very low Speed
- Under your **ISP** Administrative control
example of WAN is **Internet**

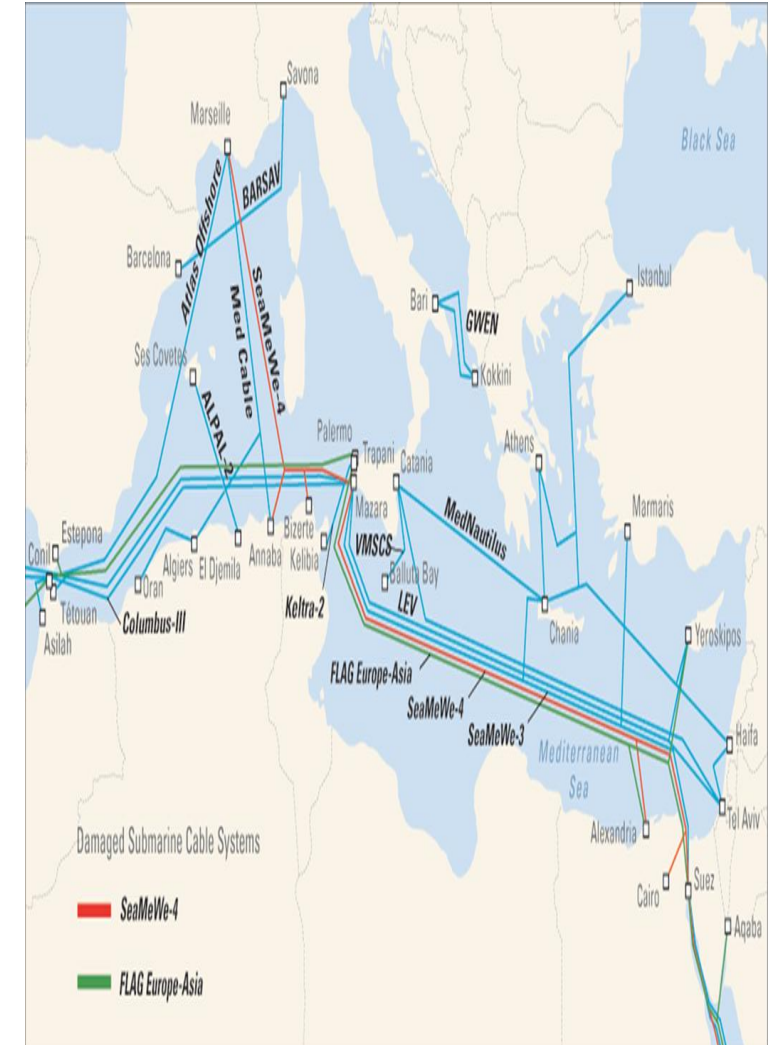

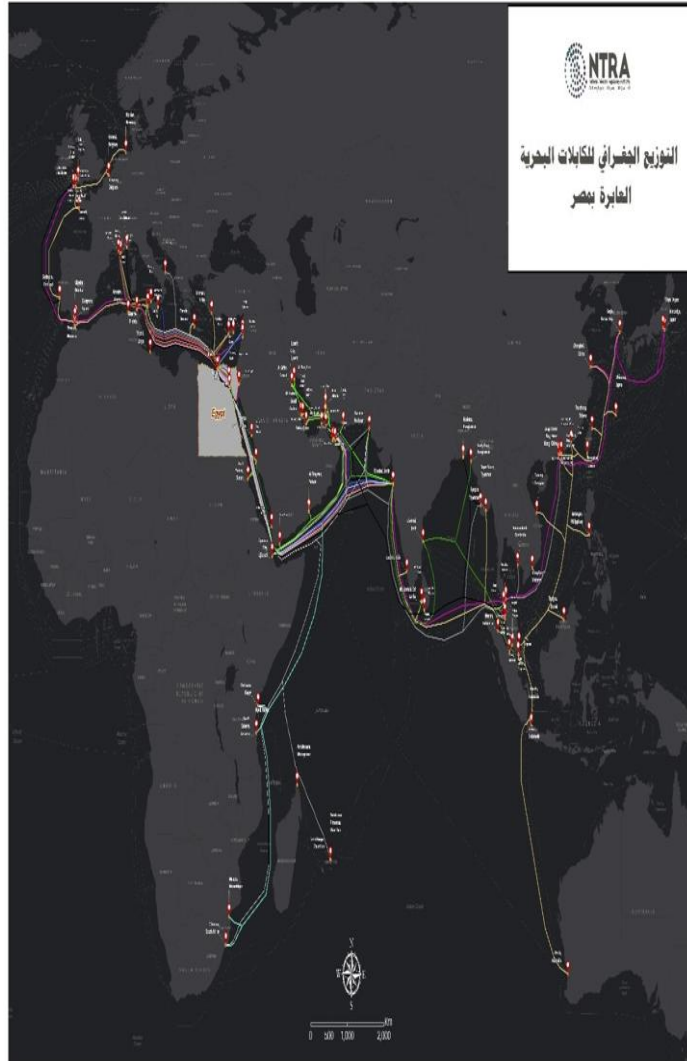

What is Internet ?

- **Internet (WWW)**

- The internet is defined as a **global mesh** of interconnected networks
- the most used service on the Internet is the **World Wide Web**
- No one actually owns the Internet
- Many Orgs, ISPs, Companies, Govs own pieces of Internet Infrastructure.
 - ISOC: Internet Society
 - IETF: Internet Engineering Task Forum
 - **ICANN**: Internet Corporation for Assigned **N**ames and **N**umbers

Internet Gateway in Egypt_ Submarine Cable

Networks Classifications

According to Network Topology

Bus – Star- Ring- Mesh-Hybrid

Network Topology

Topology

- Refers to the **shape of a network**, or the **network's layout**.
- **Types**
 - **Physical Topology:** how computers connected to each other physically (wired)
 - **Logical Topology:** how to send message from device to other, (the way in which to the generated signal actual path across the network).
- **Dependent on :**
 - **Type and number of equipment being used**
 - **Cost**

Each topology has its own **advantages and disadvantages**.

Network Topology

Star Topology

- All the devices are connected to a **centralized unit** such as a Hub or Switch.
- Nodes communicate across the network by passing data through the central device.

Network Topology

Star Topology types

❑ Hubbed Star (Broadcasted Star Topology)

- Central node can broadcast (Hub)
 - Physical star, logically bus
 - **Only one station can transmit at a time**

❑ Switched Star

- Central node can act as frame switch
 - Retransmits only to destination

Network Topology

Star Advantages and Disadvantages

❑ Advantages:

- Network not affected if one PC fails
- Network expansion and reconfiguration is simple
- Network management and monitoring can be centralized
- Troubleshooting is easy

❑ Disadvantages

- If the central device fails, all the network fails

Network Topology

Ring Topology

- A cable connects one node to another to form a ring (shape of a closed loop)
- each device is connected directly to two other devices, one on either side of it.
- All messages travel through a ring in **the same direction**
- **token** is used to transmit data and pass over each station
- **Medium access control** determines when station can insert frame

Network Topology

Frame Transmission - Ring LAN

Data transmitted in frames (token)

- ❑ Circulate past all stations
- ❑ Destination recognizes address and copies frame
- ❑ Data is passed one way from device to device.
- ❑ Frame circulates back to source where it is removed
- ❑ **Medium access control** determines when station can insert frame

Network Topology

Dual Ring Topology

- Signals travel in opposite directions.
- More resilient than single ring.

Network Topology

Ring Advantages and Disadvantages

❑ Advantages:

- **Fair** (Equal access for all users)
- Perform **well** under heavy traffic

❑ Disadvantages

- Network expansion or reconfiguration will affect the network operation
- If **one node** fails, the entire network fails
- Difficult to troubleshoot
- very bad if we have about **60** pc, Slow Network

Network Topology

Mesh Topology

- Each device/PC is connected to **every** other device/PC in the network by its own cable
- Amount of cables needed can be calculated by

$$CN = (D * (D-1)) / 2$$

(where **CN** is **Cables Needed**, and **D** is the amount of **devices** on the network)

- Mesh Types:
 - Full Mesh
 - Partial Mesh

Network Topology

Mesh Advantages and Disadvantages

□ Advantages:

- Mesh topology boasts the highest fault tolerance all of the network topologies
- **Redundancy** exist
- **Secure**

□ Disadvantages

- Because each connection needs its own cable a Mesh topology can get **very expensive**

Network Topology

Hybrid Topology

- Hybrid means that there is more than one topology exist
- Combine bus ,star and ring topologies
- Allow network expansion
- Flexible

Network Topology

Hybrid Advantages and Disadvantages

□ Advantages:

- Network **expansion is simple**

□ Disadvantages

- If hub fails connections between failed hub and other hubs will fail

Networks Classifications

According to Network Model

- Peer to Peer Networks
- Client/Server Networks

Network Model

Peer-to-Peer Networks

- **No** dedicated resources to present specific service
- **Easy** to work with
- **All nodes are the same** (equal to use the resources)

Example : Windows Workgroup

Network Model

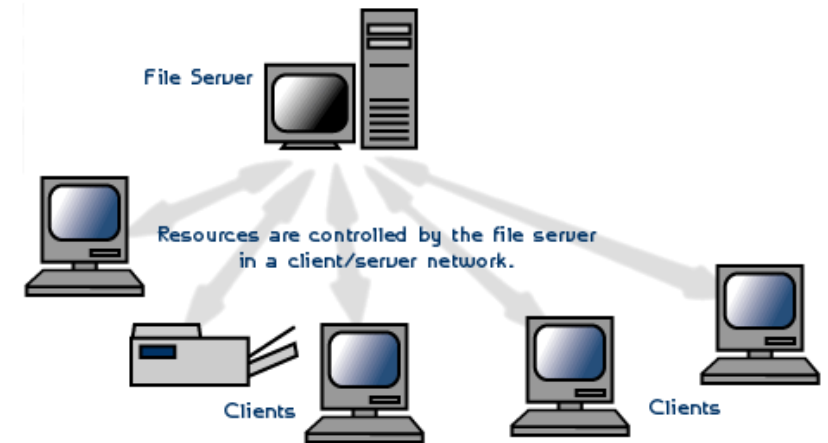

Client/Server Networks

- Some nodes (**SERVER**) are dedicated to **present services** to other nodes (**CLIENTS**)
- Server is **more powerful**

Examples:

- Mail Server
- Web Server
- File Server
- Print Server

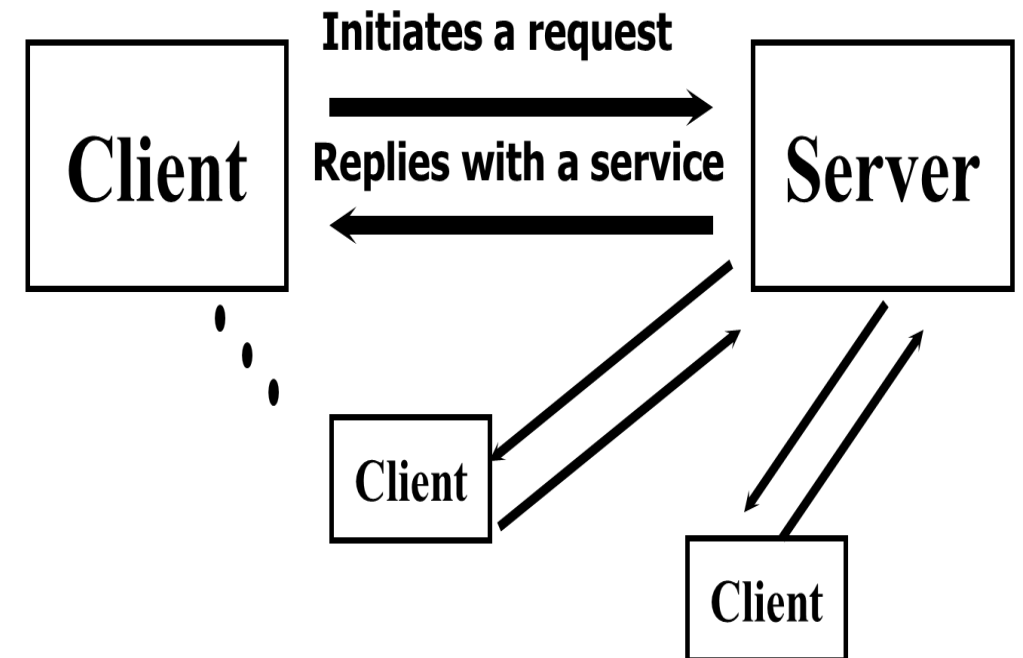

Network Model

Client/Server Networks

- computers providing the service are called **Servers**
- computers that request and use the service are called **Client** computers.
- number of servers is very small compared with the number of clients

Peer to peer vs client/server model

| | Peer to peer | Client/server |
|------------------|--|--|
| Centralization | Local machine no central server | All client machines connect to central server to get service |
| Storage | Each machine share its files equally with the others | All files and folders are on dedicated storage on the server and client access their files based on database on the server |
| Cost | inexpensive | Expensive because of server OS license |
| scalable | In home or small office | Medium/large enterprise |
| Operating system | Client operating system | Server operating system to handle multiple requests |

Thank You
